

How to get Dell Service Tag Remotely

Have you ever needed to know what the Dell service tag is of a remote system and cannot or don't want to logon to that machine and try to find out? No problem, if the laptop, desktop or server is connected to the same network as you there is a simple script you can run on your terminal "local workstations or server" . The script is rather simple as well, but you will need to have administrative rights on the remote system as well in order to pull the BIOS information. Here is how

- 1.) Open a Command prompt on your workstation or server, CMD
- 2.) Type the following
wmic /user:USERNAME /node:REMOTE-COMPUTERNAME bios get serialnumber
- 3.) Enter the password when prompted

EXAMPLE

```
C:\WINDOWS\system32\cmd.exe
C:\>wmic /user:administrator /node:laptop1 bios get serialnumber
Enter the password :*****
SerialNumber
ABCD21E
C:\>_
```
